

AI Asterion | RevenueIQ

Billing & Spend Assurance, Across Every Vertical

Every invoice proven. Every rand accounted for.

EXECUTIVE SUMMARY

RevenueIQ ingests billing and spend data, proves it reconciles, and runs a configurable rule library against it — surfacing findings, clean-control evidence, analytics and recommendations for finance and commercial teams across South Africa and the wider African market.

- 

Ships as Analysis Packs — configurable rule sets, vocabulary and reference pricing per industry, not one-size-fits-all logic.
- 

A semantics-proof reconciliation gate verifies billing ties out before any rule runs, and fails closed on ambiguous data rather than guessing.
- 

Clean-control reporting shows what passed, not only what was flagged — and never claims a control is clean if it was disabled rather than tested.
- 

Findings and evidence render natively in English, Portuguese, Afrikaans and Spanish from a single analysis run.

WHAT REVENUEIQ ENABLES

- 1

Retrospective assurance on closed billing batches
- 2

Proactive monitoring of open accounts
- 3

Reference-price and rule-based findings with full evidence
- 4

Configuration-only rule and pricing changes, no engineering cycle
- 5

One engine, four verticals: healthcare, mining, utilities, manufacturing

TYPICAL OUTCOMES

- 

Reduced billing leakage and overcharging risk
- 

Faster, evidence-backed dispute resolution
- 

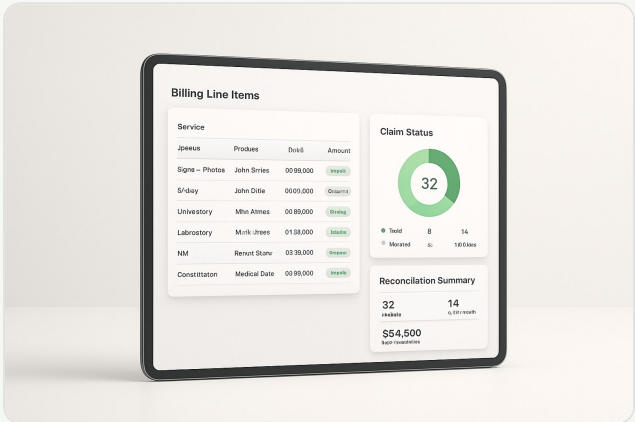

Confidence that spend matches contracted terms
- 

A defensible, auditable record for every finding

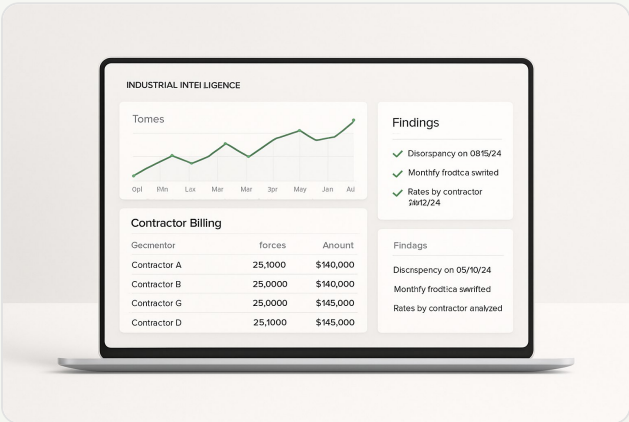

Built for Africa's Key Verticals

RevenuelQ's Analysis Packs carry their own terminology, direction of analysis, default rule set and reference prices — tuned to the billing realities of healthcare, mining, utilities and manufacturing operators across South Africa and the region.

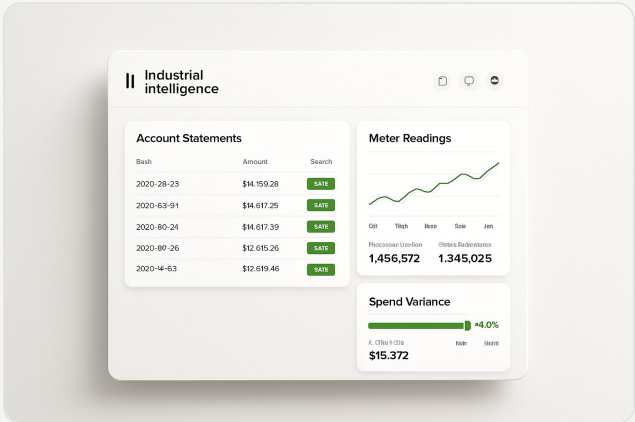

One Engine. Every Market.

1 Healthcare — Founding Pack

2 Mining

3 Utilities

VERTICAL

WHAT IT DELIVERS

1	 Healthcare The founding pack — hospital and clinic billing reconciled line by line	→ Are claims and statements billed correctly?
2	 Mining Contractor and supplier billing checked against tonnage and pricing schedules	→ Is production spend matching entitlement?
3	 Utilities Account statements and meter usage reconciled against tariff and consumption data	→ Is usage billing accurate?
4	 Manufacturing A config-only pack proving the model extends without new engine code	→ Can new verticals onboard without rebuilding the engine?

The Assurance Engine, Explained

Every finding is traceable, every clean control is earned, and every rule change is configuration — not code.

HOW FINDINGS ARE PRODUCED

-  Reconciliation runs first, and results feed directly into the rule library as data.
-  The rule library never asserts financial impact without a traceable reference value.
-  A generic tabular ingestion path — upload, field-mapping, preview and confirm — works for any billing dataset without bespoke integration.
-  The rule catalogue, reference prices and assertions are managed as configuration, exposed through a rule-set API for tenant-specific overrides.
-  A Connectors area is licence-gated per connector, not a future promise — the integrations are built.

One Platform, Every Function

RevenueIQ runs on the same shared record as every other AI Asterion module — so billing assurance connects to the contracts, assets and obligations your teams already manage.

 PURPOSE, NOT JUST FEATURES

RevenueIQ exists to close the gap between what a business is billed and what it actually owes — retrospectively, on closed batches, and proactively, on open accounts. It is built to work across verticals from day one, rather than for a single industry.

For South African and African operators — hospital groups, mining houses, utilities and manufacturers alike — that means one assurance engine that speaks the local languages, prices in local currency, and adapts to each sector's rules without a rebuild.

Finance & operations, aligned

BILLING YOU CAN TRUST. SPEND YOU CAN PROVE.
